

Therapy Approaches

Multiple Oppositions

When your speech and language therapist creates a therapy plan, there are different approaches that they can choose. There is no single intervention approach that works for every child and sometimes this may need to be changed. Based on current research and evidence based practice, your speech and language therapist will aim to select the right intervention to meet the needs of the child.

What is the multiple oppositions approach?

We work on lots of sounds all at once!

Multiple Oppositions

The multiple oppositions approach is used for children who have a favored sound which they use to replace lots of other sounds, for example, they may say 'I dan dee dud dordin' meaning 'I can see duck walking'. In this case the 'd' sound is used to replace the 'c' 's' and 'w' sounds.

The aim of multiple oppositions is to work on lots of sounds all at the same time and contrast these with their favored sound. In this case 'd' versus 'c' 's' and 'w'. Your therapist will create a range of words/non-words that rhyme and can be contrasted with their favored sound.

What happens in therapy?

- Before intervention, your therapist will create a bespoke word list for the child to work on. This may be made up of real and /or non-words that rhyme with their favored sound.
- The child will be familiarized with the sounds and words they need to learn using visuals and picture cards.
- The child will be asked to produce these words e.g. 'door vs core, saw, war' initially with help from the therapist and then without.
- Once accuracy has been achieved at word level, the child will be asked to put the words into simple phrases and sentences until generalization into everyday conversation occurs.

EXAMPLE

Sarah's speech is disordered and she uses 'd' as her favored sound, which she uses to replace 'c' 's' and 'w'

SAMPLE WORD LIST D vs C S and W

DOOR

CORE

SAW

WAR
